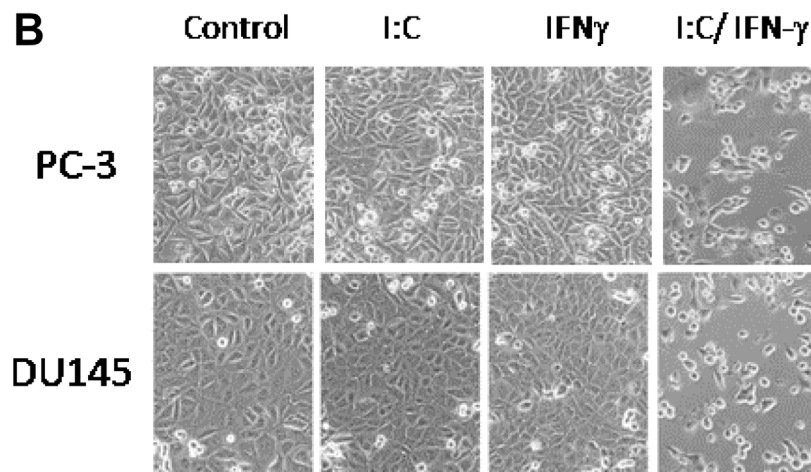

Figure 1: Effect of poly I:C and IFNs on PC-3 cell viability. PC-3 cells were treated with 1,000 unit/ml IFN α , β or γ overnight and transfected with and without 1 μ g/ml poly I:C in the presence of lipofectamine. **A.** The viable cells were analyzed by trypan blue exclusion assays and the cell numbers were averaged from three independent experiments. Error bars represent \pm SEM, and Student's *t* test was used. * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$; and **B.** The pictures were taken under Olympus CKX31 at 100 \times magnification.
